

Identifying and Managing Data Quality Requirements: A Design Science Study in the Field of Automated Driving - Artifact Package

Shameer Kumar Pradhan, Hans-Martin Heyn, Eric Knauss

1 Introduction

This document acts as an artifact package for the article titled *Identifying and Managing Data Quality Requirements: A Design Science Study in the Field of Automated Driving*. It lists and explains the components of the artifact developed in the study. It covers the following components.

- Section 2 - Data Quality Workflow
- Section 3 - List of Data Quality Challenges
- Section 4 - List of Data Quality Attributes
- Section 5 - Solution Candidates

2 Data Quality Workflow

This component presents a step-by-step workflow for assessing and managing data quality and requirements. It includes six steps, as shown in Fig. 1. Most of the steps can be performed in parallel, as depicted by the dotted line in Fig. 1. Loops indicate that the steps can be done iteratively.

Figure 1: *Data Quality Workflow* Framework Component

1. Identify data quality challenges

Challenges concerning data quality can be identified from several sources. Primary sources of data collection, such as interviews, field studies, and surveys, can be utilized to identify the challenges. Research papers and books can be used as second-hand sources as well. Furthermore, the collected challenges can be divided into different categories. In this study, they were categorized

in five groups relating with *data availability*, *data management*, *data source*, *data structure*, and *data trust*.

2. Collect and organize data quality attributes

Data quality attributes can be collected from various sources such as research papers, proceedings papers, books, standards, technical reports, Internet articles, and interviews. Data quality attributes can also be elicited from interviews. A single attribute can also represent differently phrased data quality attributes. E.g., *understandability* and *ease of understanding attributes* can be represented by the same attribute.

3. Associate data quality challenges and data quality attributes

Data quality challenges and quality attributes can be associated with each other after their identification. The association, here, means that a certain data quality challenge affects a certain data quality attribute. There is a many-to-many relationship between data quality challenge and data quality attribute, i.e., one challenge can affect more than one attribute, and one attribute can be affected by more than one challenge. For instance, *accuracy* (attribute) is affected by *data drop*, *incomplete data*, etc. (challenges); and *data drop* (challenge) can affect *accuracy*, *completeness*, etc. (attributes). However, there can be those data quality attributes that are not affected by any identified challenge and data quality challenges that do not affect any attribute.

4. Define data quality attribute metrics

Metrics to measure data quality attributes are formulated in this step. The metrics help to put a quantitative value on the attributes. For e.g., *degree of accuracy* (metric) helps to measure *accuracy* (attribute). It gives a quantifiable value for the attribute. Furthermore, formulae can be devised to calculate the metrics. E.g., the *degree of accuracy* can be calculated as a ratio of the number of correctly labeled data records and the total number of data records. The formulae are mostly dependent on the context of the application.

5. Identify solutions for data quality challenges

A way of improving data quality attribute metrics, and thus, improving quality attributes, is to determine solutions for the data quality challenges that affect the attributes. If the challenges can be mitigated or reduced, it will help improve the data quality attributes. For instance, finding a solution for *data drop* (challenge) and implementing it in the system process result in lesser data to be dropped, thus improving *completeness* (attribute). Several sources, such as research papers, technical reports, and books, can identify solutions. Teams can also brainstorm and devise new solution candidates for the challenges. An effective way to validate solution candidates is to implement them as tests in part of a system.

6. Present to stakeholders

As the final step, identified data quality challenges, attributes, and solution candidates should be presented to appropriate stakeholders. They could be higher management, other colleagues, or customers. A suitable form of presentation should also be decided.

3 List of Data Quality Challenges

Table 1: Definition of Challenge Sets and List of Challenges

Challenge Set	Definition	Challenges
Data Availability Challenges	These challenges affect the availability of data during processing by AI models.	Data Delay, Data Drop, Incomplete Data, Low Labeled Data Volume
Data Management Challenges	These challenges relate to data management and operations performed on data.	Data Acquisition, Data Ownership, Expensive Procedure, Imbalanced Dataset, Improper Data Transfer, Large Volume of Data, Manual Data Collection, Manual Data Labeling, Redundant Data, Regulatory Compliance, Reliance on Suppliers to Raise Error, Time Consuming
Data Source Challenges	These are the data quality challenges caused due to the source of the data.	Data Dependent on External Conditions, Lack of Variety in Test Environment, New Data Type, Wrongly-calibrated / Defective Sensors
Data Structure Challenges	These challenges are related to the format and structure of the data.	Fragmented Data, Incompatible Data Format, Outlier Data, Unstructured Data
Data Trust Challenges	These challenges are caused by the lack of transparency in the data and its quality to extract meaningful information.	Noise, Lack of Good Data from Simulations, Incorrect Labeling

* denotes challenges identified through interviews with experts

^ denotes challenges identified through literature review

Figure 2: Identified Challenges Divided in Challenge Sets

Note:

- NA: Not Applicable
- The numbers in the brackets are the weighted average values for the challenge-attribute association calculated from the results of the focus group session and survey 2.
- The first number inside the brackets denotes the weighted average from the focus group results, and the second number denotes the weighted average from survey 2.
- If there is no weighted average from either focus group or survey, the space is left blank. E.g., (, 1) would mean that there is no weighted average from the focus group, but there is a weighted average from survey 2. In the same way, (1,) means vice versa.
- The meaning of weighted average is explained in the main article.

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Access Security	Wang & Strong (1996)	<i>The extent to which access to data can be restricted and hence kept secure. (Wang & Strong 1996)</i>	Regulatory Compliance (, 0.66)
Accessibility	Cai & Zhu (2015) , Sidi et al. (2012) , Wang & Strong (1996) , International Organization for Standardization (2008) , European Commission. Statistical Office of the European Union. (2020) , DQMatters.com (2017)	<i>The conditions and modalities by which users can access, use and interpret data. (European Commission. Statistical Office of the European Union. 2020),</i> <i>The extent to which data are available or easily and quickly retrievable. (Wang & Strong 1996)</i>	Data Acquisition (0.8, 0.66), Data Delay (0.5, 0.5), Data Dependent on External Conditions (1, 1), Data Drop (0.6, 0.5), Data Ownership (, 1), Manual Data Collection (0.2, 0.66)

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Accuracy	Interviewees, Cai & Zhu (2015), Bobrowski et al. (1998), Sidi et al. (2012), Wang & Strong (1996), International Organization for Standardization (2008)	<p><i>The degree to which data values correctly represents real-world entities. (Data Management Association et al. 2017),</i></p> <p><i>The extent to which data are correct, reliable, and certified free of error. (Wang & Strong 1996),</i></p> <p><i>Accuracy of data is the closeness of computations or estimates to the exact or true values that the statistics were intended to measure. (European Commission. Statistical Office of the European Union. 2020)</i></p>	Data Dependent on External Conditions (0.6, 0), Data Drop (0.8, 1), Incomplete Data (1, 1), Incorrect Labeling (1, 1), Lack of Good Data from Simulations (0.8, 0.66), Low Labeled Data Volume (0.8, 1), Noise (1, 0.66), Outlier Data (0.4, 0.66), Redundant Data (0.4, 0.33)
Amount of Data	Bobrowski et al. (1998), Wang & Strong (1996)	<p><i>The number of facts stored. (Bobrowski et al. 1998),</i></p> <p><i>The extent to which the quantity or volume of available data is appropriate. (Wang & Strong 1996)</i></p>	NA
Appropriate Amount of Data	Sidi et al. (2012), Wang & Strong (1996)	<i>The extent to which the quantity or volume of available data is appropriate. (Wang & Strong 1996)</i>	NA
Auditability	Cai & Zhu (2015)	<i>It means that auditors can fairly evaluate data accuracy and integrity within rational time and manpower limits during the data use phase. (Cai & Zhu 2015)</i>	Data Ownership (, 0.33)
Authorization	Cai & Zhu (2015)	<i>It refers to whether an individual or organization has the right to use the data. Cai & Zhu (2015)</i>	NA

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Availability	Interviewees, Cai & Zhu (2015) , Sidi et al. (2012) , International Organization for Standardization (2008)	<i>The degree to which data has attributes that enable it to be retrieved by authorized users and/or applications in a specific context of use. (International Organization for Standardization 2008)</i>	Data Acquisition (1, 0.66), Data Delay (0.25, 0.5), Data Drop (1, 0.75), Incomplete Data (0.6, 0.75), Low Labeled Data Volume (0.2, 0.25)
Believability / Credibility / Reputation	Sidi et al. (2012) , Wang & Strong (1996) , Cai & Zhu (2015) , International Organization for Standardization (2008)	<i>The degree to which data has attributes that are regarded as true and believable by users in a specific context of use. Credibility includes the concept of authenticity (the truthfulness of origins, attributions, commitments). (International Organization for Standardization 2008),</i> <i>The extent to which data are trusted or highly regarded in terms of their source or content. (Wang & Strong 1996)</i>	Incomplete Data (1, 1), Incorrect Labeling (1, 1), Lack of Good Data from Simulations (0.6, 1), Outlier Data (0.2, 1), Unstructured Data (, 0)
Clarity / Interpretability / Unambiguous	Bobrowski et al. (1998) , Sidi et al. (2012) , Wang & Strong (1996) , European Commission. Statistical Office of the European Union. (2020)	<i>The extent to which data are in an appropriate language and units and the data definitions are clear. (Wang & Strong 1996)</i>	Incompatible Data Formats (, 1)
Coherence and Comparability	European Commission. Statistical Office of the European Union. (2020)	<i>Adequacy of statistics to be reliably combined in different ways and for various uses and the extent to which differences between statistics can be attributed to differences between the true values of the statistical characteristics. European Commission. Statistical Office of the European Union. (2020)</i>	NA
Comment	European Commission. Statistical Office of the European Union. (2020)	<i>Supplementary descriptive text which can be attached to data or metadata. (European Commission. Statistical Office of the European Union. 2020)</i>	NA

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Completeness	Interviewees, Cai & Zhu (2015), Bobrowski et al. (1998), Sidi et al. (2012), Wang & Strong (1996)	<p><i>Refers to whether all required data is present. (Data Management Association et al. 2017),</i></p> <p><i>The extent to which data are of sufficient breadth, depth, and scope for the task at hand. (Wang & Strong 1996)</i></p>	Data Delay (0, 0.25), Data Drop (0.8, 1), Improper Data Transfer (0.6, 1), Incomplete Data (1, 1)
Compliance	International Organization for Standardization (2008)	<i>The degree to which data has attributes that adhere to standards, conventions or regulations in force and similar rules relating to data quality in a specific context of use. International Organization for Standardization (2008)</i>	Data Ownership (, 1), Regulatory Compliance (, 1)
Conciseness / Concise Representation	Bobrowski et al. (1998), Sidi et al. (2012), Wang & Strong (1996)	<i>The extent to which data are compactly represented without being overwhelming (i.e., brief in presentation, yet complete and to the point). (Wang & Strong 1996)</i>	NA
Confidentiality	European Commission. Statistical Office of the European Union. (2020), International Organization for Standardization (2008)	<p><i>A property of data indicating the extent to which their unauthorised disclosure could be prejudicial or harmful to the interest of the source or other relevant parties. (European Commission. Statistical Office of the European Union. 2020)</i></p> <p><i>The degree to which data has attributes that ensure that it is only accessible and interpretable by authorized users in a specific context of use. (International Organization for Standardization 2008)</i></p>	Data Ownership (, 0.66), Regulatory Compliance (, 0.66)

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Cost Effectiveness	Wang & Strong (1996)	<i>The extent to which the cost of collecting appropriate data is reasonable. (Wang & Strong 1996)</i>	Data Acquisition (1, 0.66), Manual Data Collection (1, 0.66), Manual Data Labeling (1,)
Currency / Currentness	Sidi et al. (2012), Data Management Association et al. (2017), DQMatters.com (2017), International Organization for Standardization (2008)	<i>The measure of whether data values are the most up-to-date version of the information. (Data Management Association et al. 2017), The degree to which data has attributes that are of the right age in a specific context of use. (International Organization for Standardization 2008)</i>	Data Delay (1, 0.75), Data Drop (0.4, 0.25), Improper Data Transfer (0.4, 1), Incomplete Data (0, 0.75)
Data Coverage	Sidi et al. (2012)	<i>A measure of the availability and comprehensiveness of data compared to the total data universe or population of interest. (Sidi et al. 2012)</i>	NA
Data Decay	Sidi et al. (2012)	<i>A measure of the rate of negative change to data. (Sidi et al. 2012)</i>	NA
Data Revision	European Commission. Statistical Office of the European Union. (2020)	<i>Any change in a value of a statistic released to the public. (European Commission. Statistical Office of the European Union. 2020)</i>	NA
Data Specification	Sidi et al. (2012)	<i>A measure of the existence, completeness, quality and documentation of data standards, data models, business rules, meta data, and reference data. (Sidi et al. 2012)</i>	NA
Definition / Documentation	Cai & Zhu (2015)	<i>It consists of data specification, which includes data name, definition, ranges of valid values, standard formats, business rules, etc. Normative data definition improves the degree of data usage. (Cai & Zhu 2015)</i>	NA
Duplication	Sidi et al. (2012)	<i>A measure of unwanted duplication existing within or across systems for a particular field, record, or data set. (Sidi et al. 2012)</i>	NA

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Frequency of Dissemination	European Commission. Statistical Office of the European Union. (2020)	<i>The time interval at which the statistics are disseminated over a given time period. (European Commission. Statistical Office of the European Union. 2020)</i>	Regulatory Compliance (, 0.66)
Freshness	Sidi et al. (2012)	<i>Freshness represents a family of quality factors which each one representing some freshness aspect and having on its metrics. (Peralta 2006)</i>	NA
Institutional Mandate	European Commission. Statistical Office of the European Union. (2020)	<i>Law, set of rules or other formal set of instructions assigning responsibility as well as the authority to an organisation for the collection, processing, and dissemination of statistics. (European Commission. Statistical Office of the European Union. 2020)</i>	Regulatory Compliance (, 1)
Integrity	Cai & Zhu (2015) , Sidi et al. (2012) , DQMatters.com (2017)	<i>Measures the structural or relational quality of datasets. (DQMatters.com 2017)</i>	NA
Integrity or Coherence	See <i>Integrity</i> and <i>Coherence</i>		
Latency	Data Management Association et al. (2017)	<i>The time between when the data was created and when it was made available for use. (Data Management Association et al. 2017)</i>	Data Delay (1, 1)
Learnability	Sidi et al. (2012)	<i>It means the capability of the function to enable to user to learn it. (Heravizadeh et al. 2009), (Sidi et al. 2012)</i>	NA
Lineage	DQMatters.com (2017)	<i>Lineage measures whether factual documentation exists about where data came from, how it was transformed, where it went and end-to-end graphical illustration. (DQMatters.com 2017)</i>	Data Acquisition (1, 1), Data Ownership (, 0.66), Regulatory Compliance (, 0.66)

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Metadata	Cai & Zhu (2015)	<i>With the increase of data sources and data types, because data consumers distort the meaning of common terminology and concepts of data, using data may bring risks. Therefore, data producers need to provide metadata describing different aspects of the datasets to reduce the problems caused by misunderstanding or inconsistencies. (Cai & Zhu 2015)</i>	NA
Metadata Update	European Commission. Statistical Office of the European Union. (2020)	<i>The date on which the metadata element was inserted or modified in the database. (European Commission. Statistical Office of the European Union. 2020)</i>	NA
Navigation	Sidi et al. (2012)	<i>Extent to which data are easily found and linked to. (Knight & Burn 2005), (Sidi et al. 2012)</i>	NA
Objectivity	Bobrowski et al. (1998), Sidi et al. (2012), Wang & Strong (1996)	<i>The extent to which data are unbiased (unprejudiced) and impartial. (Wang & Strong 1996)</i>	Data Drop (0.2, 0.75), Incomplete Data (0.2, 1), Incorrect Labeling (0.6, 1), Lack of Good Data from Simulations (0.8, 1), Low Labeled Data Volume (0.6, 0.75), Noise (0.2, 0.66), Outlier Data (0.2, 0.33), Redundant Data (0.2, 0.33)
Portability	International Organization for Standardization (2008)	<i>The degree to which data has attributes that enable it to be installed, replaced or moved from one system to another (while) preserving the existing quality in a specific context of use. (International Organization for Standardization 2008)</i>	Data Delay (0, 0), Data Drop (0.2, 0.33), Improper Data Transfer (0.8, 0.66), Regulatory Compliance (, 0.66)
Precision	Bobrowski et al. (1998), International Organization for Standardization (2008)	<i>The degree to which data has attributes that are exact or that provide discrimination in a specific context of use. (International Organization for Standardization 2008)</i>	NA

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Presentation Quality	Sidi et al. (2012)	<i>A measure of how information is presented to and collected from does how utilize it. Format and appearance support appropriate use of information. (McGilvray 2008), (Sidi et al. 2012)</i>	NA
Punctuality	European Commission. Statistical Office of the European Union. (2020)	<i>Time lag between the actual delivery of the data and the target date when it should have been delivered. (European Commission. Statistical Office of the European Union. 2020)</i>	NA
Quality Management	European Commission. Statistical Office of the European Union. (2020)	<i>Systems and frameworks in place within an organisation to manage the quality of statistical products and processes. (European Commission. Statistical Office of the European Union. 2020)</i>	NA
Readability	Cai & Zhu (2015)	<i>It is defined as the ability of data content to be correctly explained according to known or well-defined terms, attributes, units, codes, abbreviations, or other information. (Cai & Zhu 2015)</i>	NA
Reasonability	Data Management Association et al. (2017)	<i>Asks whether a data pattern meets expectations. (Data Management Association et al. 2017)</i>	Data Drop (0.4, 0.5), Incomplete Data (0.8, 0.5)
Recoverability	International Organization for Standardization (2008)	<i>The degree to which data has attributes that enable it to maintain and preserve a specified level of operations and quality, even in the event of failure, in a specific context of use. (International Organization for Standardization 2008)</i>	NA
Reference Period	European Commission. Statistical Office of the European Union. (2020)	<i>The period of time or point in time to which the measured observation is intended to refer. (European Commission. Statistical Office of the European Union. 2020)</i>	NA
Release Policy	European Commission. Statistical Office of the European Union. (2020)	<i>Rules for disseminating statistical data to all interested parties. (European Commission. Statistical Office of the European Union. 2020)</i>	Regulatory Compliance (, 0)

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Relevance	Cai & Zhu (2015), Bobrowski et al. (1998), Sidi et al. (2012), Wang & Strong (1996), European Commission. Statistical Office of the European Union. (2020)	<i>The extent to which data are applicable and helpful for the task at hand. (Wang & Strong 1996),</i> <i>The degree to which statistical information meet current and potential needs of the users. (European Commission. Statistical Office of the European Union. 2020)</i>	New Data Type (, 0.33)
Reliability	Cai & Zhu (2015), Bobrowski et al. (1998), Sidi et al. (2012)	<i>Reliability of the data, defined as the closeness of the initial estimated value to the subsequent estimated value. (European Commission. Statistical Office of the European Union. 2020)</i>	Data Drop (0.8, 1), Improper Data Transfer (0.8, 0.66), Incomplete Data (0.8, 1), Incorrect Labeling (1, 1)
Representation	DQMatters.com (2017)	<i>Representation measures ease of understanding data, consistency of presentation, appropriate media choice, and availability of documentation (metadata). (DQMatters.com 2017)</i>	NA
Safety	Sidi et al. (2012)	<i>It is the capability of the function to achieve acceptable levels of risk of harm to people, process, property or the environment. (Heravizadeh et al. 2009), (Sidi et al. 2012)</i>	NA
Security	Sidi et al. (2012)	<i>Extent to which access to information is restricted appropriately to maintain its security. (Wang & Strong 1996), (Sidi et al. 2012)</i>	NA
Statistical Presentation	European Commission. Statistical Office of the European Union. (2020)	<i>Description of the disseminated data which can be displayed to users as tables, graphs or maps. (European Commission. Statistical Office of the European Union. 2020)</i>	NA

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Statistical Processing	European Commission. Statistical Office of the European Union. (2020)	This concept and all its sub-concepts are included in ESQRS based (producer) reports. The concept is ESQRS Concept 3. However Sub-concept S.18.5.1 is ESQRS Sub-concept 6.3.4.1 and Sub-concept S.18.6.1 is ESQRS Sub-concept 6.4 (European Commission. Statistical Office of the European Union. 2020).	NA
Structure	Cai & Zhu (2015)	<i>It refers to the level of difficulty in transforming semi-structured or unstructured data to structured data through technology. (Cai & Zhu 2015)</i>	Unstructured Data (, 0.66)
Timeliness	Cai & Zhu (2015), Bobrowski et al. (1998), Sidi et al. (2012), Wang & Strong (1996), Data Management Association et al. (2017), DQMatters.com (2017)	<i>Length of time between data availability and the event or phenomenon the data describe. (European Commission. Statistical Office of the European Union. 2020),</i> <i>The extent to which the age of the data is appropriate for the task at hand. (Wang & Strong 1996)</i>	Data Delay (1, 0.75), Data Drop (0.6, 0.25), Manual Data Collection (0.2, 0.66), Manual Data Labeling (, 0.8)
Timeliness and Availability	Sidi et al. (2012)	<i>A measure of the degree to which data are current and available for use as specified and in the time frame in which they are expected. (McGilvray 2008), (Sidi et al. 2012)</i>	NA
Traceability	Wang & Strong (1996), International Organization for Standardization (2008)	<i>The extent to which data are well documented, verifiable, and easily attributed to a source. (Wang & Strong 1996),</i> <i>The degree to which data has attributes that provide an audit trail of access to the data and of any changes made to the data in a specific context of use. (International Organization for Standardization 2008)</i>	Data Acquisition (0.8, 1), Data Ownership (, 0.66), Regulatory Compliance (, 0.66)

Table 2: List of Data Quality Attributes, Their Sources, Definitions, and Association with Data Quality Challenges

DQ Attribute	Source	Definition	Challenge affecting the DQ attribute
Value Added	Sidi et al. (2012) , Wang & Strong (1996)	<i>The extent to which data are beneficial and provide advantages from their use. (Wang & Strong 1996)</i>	NA
Variety of Data Sources	Wang & Strong (1996)	<i>The extent to which data are available from several differing data sources. (Wang & Strong 1996)</i>	Lack of Good Data from Simulations (0.4, 1)
Volatility	Data Management Association et al. (2017)	<i>Remain current for a short period. (Data Management Association et al. 2017)</i>	NA

Figure 3: Flowchart for *Auto Increasing Sequential Number Solution*

Figure 4: Flowchart for *Automated Labeling* Solution

5.3 Continuous Data Processing

Challenge it Tries to Solve: Data Delay

Requirement Specifications:

1. Add new fields for departure timestamp and arrival timestamp in database,
2. Determine an acceptable range of time for data arrival

Implementation Details:

- First, above mentioned requirement specifications, should be completed.
- Then, when the data arrives for processing, check if it is in the initial processing stage.
- CHECK_PIPELINE: If it is, check if there is data in the data pipeline.
 - If there is data in the pipeline, start processing that particular piece of data without waiting for the rest of the data.
 - CHECK_END: If there is no data in the pipeline, check if it is the end of processing.
 - * If it is the end of processing, stop.
 - * If it is not the end of processing, identify that there is a data delay.
 - * Check if data departure timestamp is there or not.
 - If data departure timestamp exists, compute the total time taken by finding the difference between arrival and departure times.
 - Check if the time taken is within the acceptable range.
 - If it is within the acceptable range, stop.
 - If it is not within the acceptable range, notify appropriate stakeholders about the data delay.
- If it is not the initial stage of processing, check if the stage is mid-processing.
 - If yes, continue from CHECK_PIPELINE.
- If the stage is not mid-processing, continue from CHECK_END.

Figure 5: Flowchart for *Continuous Data Processing* Solution

5.4 Corroboration of Data with Central Data Repository

Challenge it Tries to Solve: Data Dependent on External Conditions

Requirement Specifications:

1. Define the central data repository, its structure, and address,
2. Define the procedure if the central data repository cannot be contacted,
3. Define the way AI disengagement notification is sent to the user

Implementation Details:

- First, above mentioned requirement specifications, should be completed.
- Check if a central repository of data exists.
- If a central repository of data exists, contact that repository. Check if the required data is available in the repository.
 - If the required data is available in the repository, fetch the data, process it, and take appropriate steps.
 - If the required data is not available in the repository, disengage AI.
- If a central data repository does not exist, check if the system behaves correctly.
 - If the system is behaving properly, process the existing data and take appropriate steps.
 - If the system is not behaving properly, disengage AI.
- When AI is disengaged, send a notification of the disengagement to the user.

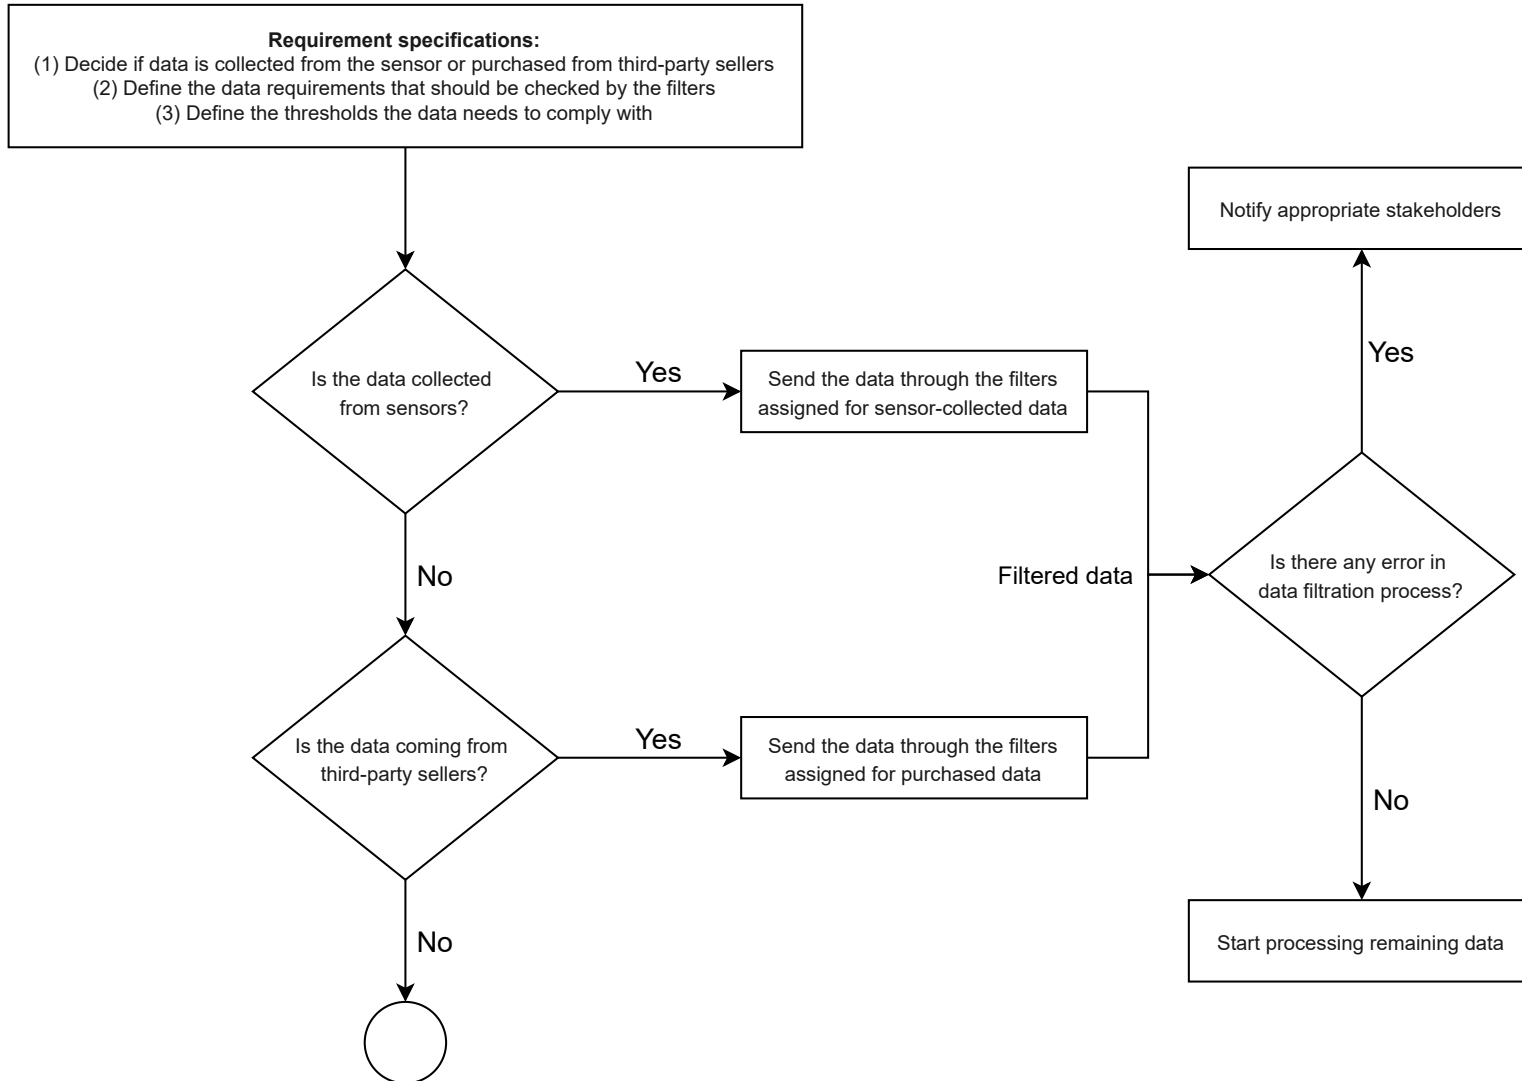

Figure 6: Flowchart for *Corroboration of Data with Central Data Repository Solution*

Figure 8: Flowchart for *Data Filter* Solution

Figure 10: Flowchart for *Identify Mandatory and Optional Fields* Solution

5.9 Improper Data Transfer Solution Task

Challenge it Tries to Solve: Improper Data Transfer

Requirement Specifications:

1. Specify the data transmission standards to follow.
2. Specify the modes of data transmission.
3. Specify the process of data transmission.

Implementation Details: NA

Figure 11: Requirement Specifications for *Improper Data Transfer* Solution Task

5.10 Outlier Techniques

Challenge it Tries to Solve: Outlier Data

Requirement Specifications: Not Applicable

Implementation Details:

- According to [Anscombe \(1960\)](#), outlier data can be divided into two main categories - those arising from errors in data and those arising from inherent variability of the data.
- To handle outlier data, first, decide whether the step is to identify outlier data or treat outlier data.
- Two methods to identify outlier data include determining data outside interquartile range ([Kwak & Kim 2017](#)) and regression analysis ([Gentleman & Wilk 1975](#)).
 - Regression analysis, on the other hand, utilizes simple residuals that are "adjusted by the predicted values, and standardized residuals against the observed values to detect outliers" ([Gentleman & Wilk 1975](#)).
- There are also several ways to treat outlier data. Some of them are mentioned in this thesis. They are *Least trimmed squares* ([Rousseeuw & Leroy 1987](#)), *Windsorization* ([Kwak & Kim 2017](#)) ([Osborne & Overbay 2004](#)), *Least median of squares* ([Rousseeuw & Leroy 1987](#)), *Robust estimation method* ([Osborne & Overbay 2004](#)), *Trimming* ([Kwak & Kim 2017](#)), *Transformation* ([Osborne & Overbay 2004](#)), and *Truncation* ([Osborne & Overbay 2004](#)).

Figure 12: Flowchart for *Outlier Techniques* Solution

Requirements specifications:
 (1) Define the types of environment in which data should be collected, depending on the context.
 (2) Determine if real-world data collection and/or simulated environment data collection is suitable for the context
